Southern Region
Quarterly Climate Impacts and Outlook | March 2017

Highlights for the Region

- It was a warmer than normal winter (December–February) for the southern region, with all six states reporting warmer than normal temperatures in December, January, and February, with many states having their warmest February on record.

- Precipitation was abundant in southern Texas, and western Oklahoma. In Tennessee, much needed rain fell to help put out some of the Great Smoky Mountain wildfires.

- The March 2016–February 2017 temperatures were the warmest on record for the southern region as a whole, with Louisiana and Oklahoma reported their warmest March–February on record, and the other states reported one of their top five warmest March–February.

The average U.S. temperature during February was 41.2°F, 7.3°F above average, and the second warmest on record. The winter U.S. temperature was 35.9°F, 3.7°F above average, and the sixth highest on record. February U.S. precipitation was 2.21 inches, 0.08 inches above average. The winter precipitation total was 8.22 inches, 1.43 inches above average, and eighth wettest on record.

Regional – Climate Overview for December 2016–February 2017

Temperature and Precipitation Anomalies

Overall, temperatures averaged between 2°F to 8°F above normal for most of the period spanning from December 2016 to February 2017. Temperature anomalies in Louisiana, Mississippi, and southern Texas were slightly higher with the majority of stations averaging between 6°F to 10°F above normal. Both Louisiana and Texas had their warmest winter on record (1895–2017), with Louisiana reporting an average winter temperature of 57.7°F. Arkansas and Tennessee had their second warmest winter on record.

Winter precipitation was variable throughout the southern region. Western Texas and Oklahoma reported 150–300% above normal precipitation, whereas areas in Arkansas reported 25–50% below normal precipitation. Northern Mississippi and northern Louisiana had below normal precipitation for the winter months. In contrast, the southern parts of those states were near normal precipitation. Some much needed rain fell in Tennessee in December and January to help put out some of the Great Smoky Mountain wildfires.

Streamflows

The above figure illustrates the February average streamflow in the Texas Gulf and lower Mississippi basins as compared to historical streamflow. Streamflows in Texas are exhibiting near normal flow, except for in the eastern counties where a cluster of stations are below normal. There are areas in central Louisiana and Mississippi that are below normal to much below normal. Many locations in Arkansas and Tennessee are reporting near normal conditions.
Regional – Impacts for January–March 2017

Warm Winter 2016–17

The southern region had its warmest winter on record in 2016–17. The temperature change throughout the region in December was variable, with the northern part of the region reporting near normal or slightly below normal temperatures. The southern part of the region reported, on average, 2°F–4°F above average for the month of December. In January most of the region reported above normal temperatures, with portions of Louisiana, Mississippi, and Tennessee having 6°F–10°F above normal temperatures. The panhandles of Texas and Oklahoma exhibited near normal temperatures. In February, there were no areas in the southern region that were below or near normal. The whole region averaged 2°F above normal, with portions of each state reporting 9°F–12°F above normal. Louisiana did not have any areas where there were below or near normal temperatures for any winter month. In the entirety of winter 2016–17, Louisiana and Texas reported their warmest winter, Arkansas and Tennessee reported their second warmest winter, Mississippi reported its third warmest winter, and Oklahoma reported its fifth warmest winter. Farmers are concerned about the crops throughout the region, with growing degree days and growing cycles being affected by the warm temperatures. For some farmers in southern Texas, the unseasonable warmth has them anxious to start farming their spring crops earlier than usual according to the Southwest FarmPress in February 2017. Some farmers already have their tractors out in hopes to get an early start on the planting year, which is many farmers’ optimal outcome.

CPC Three-Month Outlook

</tbody>
</table>

A = Above normal temperatures  
B = Below normal rainfall  
EC = Equal chances  
N = Normal

According to the Climate Prediction Center, Spring (April, May, June) temperatures for the southern region are expected to be above normal in all six states.

For most of the southern region, the Climate Prediction Center is giving equal chances of above or below normal Spring (April, May, June) precipitation, except for along the Gulf coast, where there is a slight chance of above normal rainfall.

Mar 2016–Feb 2017 Temperatures

As of February 28, 2017, the southern region as a whole had its warmest March 2016–February 2017 on record (recorded since 1895). Louisiana and Oklahoma saw their highest average temperatures ever for March 2016–February 2017. The other states had their second or third warmest March–February on record.
